The AL Acoustic Louvre has been designed to provide broad band attenuation which is particularly effective at medium and high frequencies. The louvre blades are pitched at 175mm centres, with the top of the blade being solid metal, formed to have a rear weatherlip. The acoustic medium to the underbelly is secured by perforated metal to allow absorption of the sound waves. The louvre is designed for traditional applications; duct terminal, compressor rooms etc, but can also be used as screen (roof top or similar) since the acoustic medium does not soak up water and is rot and vermin proof. Can be used alone or placed behind other louvre systems.
